# What is Lisp?

## Definition (Lisp)

A family of programming languages based on s-expressions.

### "Math"

$$n! = \begin{cases} 1 & \text{if } n = 0 \\ n * (n - 1)! & \text{if } n \neq 0 \end{cases}$$

### Code

```
(defun fact (n)
  (if (= n 0)
      1
      (* n (fact (- n 1)))))
```

### Data Structure

# Homoiconic

Code is Data

Code

```
(defun fact (n)
  (if (= n 0)
      1
      (* n (fact (- n 1)))))
```

Data Structure

<https://tutorcs.com>

WeChat: cstutorcs

“data processing”  $\iff$  “code processing”

# Introduction

## Why study Lisp?

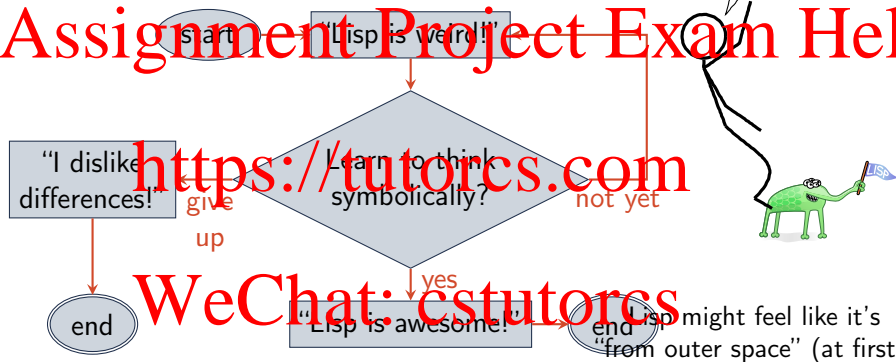

- ▶ Functional Programming:
  - ▶ Planning algorithms often are functional/recursive
  - ▶ Lisp has good support for functional programming.
- ▶ Symbolic Computing:
  - ▶ Planning algorithms must often process symbolic expressions
  - ▶ Lisp has good support for symbolic processing
- ▶ Understanding the abstractions in Lisp will make you a better programmer.

## Outcomes

- ▶ Understand Lisp abstractions
  - ▶ Symbols
  - ▶ S-expressions
  - ▶ First-class functions (closures)
- ▶ Implement Lisp programs in functional style
- ▶ Review differential calculus and numerical methods)

# The Lisp Learning Process

Assignment Project Exam Help

<https://tutorcs.com>

WeChat: cstutorcs

*The symbolic view of programming is different, often useful.*

## Lots of Irritating Silly Parenthesis?

“LISP has jokingly been described as ‘the most intelligent way to misuse a computer’. I think that description a great compliment because it transmits the full flavour of liberation: it has assisted a number of our most gifted fellow humans in **thinking previously impossible thoughts.**” [emphasis added]

## Booleans and Equality

"Math"	Lisp	Notes
False	nil	equivalent to the empty list ()
True	t	or any non-nil value
$\neg a$	(not a)	
$a = b$	(= a b)	numerical comparison
$a = b$	(eq a b)	same object
$a = b$	(eql a b)	same object, same number and type, or same character
$a = b$	(equal a b)	eql objects, or lists/arrays with equal elements
$a = b$	(equalp a b)	= numbers, or same character (case-insensitive), or recursively-equalp cons cells, arrays, structures, hash tables
$a \neq b$	(not (= a b))	similarly for other equality functions

## Example: Lisp Equality Operators

- Assignment Project Exam Help  
<https://tutorcs.com>  
 WeChat: cstutorcs
- ▶ `(= 1 1)`  $\rightsquigarrow$  `t`
  - ▶ `(eq 1 1)`  $\rightsquigarrow$  `t`
  - ▶ `(= integer1 float1.0)`  $\rightsquigarrow$  `t`
  - ▶ `(eq integer1 float1.0)`  $\rightsquigarrow$  `nil`
  - ▶ `(eql integer1 float1.0)`  $\rightsquigarrow$  `nil`
  - ▶ `(equal integer1 float1.0)`  $\rightsquigarrow$  `nil`
  - ▶ `(equalp integer1 float1.0)`  $\rightsquigarrow$  `t`
  - ▶ `(= "a" "a")`  $\rightsquigarrow$  `error`
  - ▶ `(eq "a" "a")`  $\rightsquigarrow$  `nil`
  - ▶ `(eql "a" "a")`  $\rightsquigarrow$  `nil`
  - ▶ `(equal "a" "a")`  $\rightsquigarrow$  `t`
  - ▶ `(equal "a" "A")`  $\rightsquigarrow$  `nil`
  - ▶ `(equalp "a" "A")`  $\rightsquigarrow$  `t`
  - ▶ `(not t)`  $\rightsquigarrow$  `nil`
  - ▶ `(not nil)`  $\rightsquigarrow$  `t`
  - ▶ `(not "a")`  $\rightsquigarrow$  `nil`

## Exercise: Lisp Equality Operators

## Assignment Project Exam Help

- |   |   |
|---|---|
| ▶ (not 0) $\rightsquigarrow$ nil            | ▶ (eq (list "a" "b") (list "a" "b")) $\rightsquigarrow$ nil   |
| ▶ (not 1) $\rightsquigarrow$ nil            | ▶ (equal (list "a" "b") (list "a" "b")) $\rightsquigarrow$ t  |
| ▶ (eq t (not nil)) $\rightsquigarrow$ t     |   |
| ▶ (eq t 1) $\rightsquigarrow$ nil           | ▶ (eq (list "a" "b") (list "a" "B")) $\rightsquigarrow$ nil   |
| ▶ (eq nil (not 1)) $\rightsquigarrow$ t     | ▶ (equal (list "a" "b") (list "a" "B")) $\rightsquigarrow$    |

WeChat: cstutorcs

## Function Definition

**DEFUN**  
Defines a new function in the global environment.

```
(defun FUNCTION-NAME ARGUMENTS BODY...)
```

## Pseudocode

**Procedure** `increment(n)`

```
1 return  $n + 1$ ;
```

## Common Lisp

```

      function name  function arguments
      {              {
(defun increment    (n)
      {              {
      (+ n 1))
      {              {
      result
  
```

## Exercise: Function Definition

Sine Cardinal

# Assignment Project Exam Help

$$\text{sinc}(\theta) = \frac{\sin \theta}{\theta}$$

Pseudocode

---

**Procedure** sinc( $\theta$ )
 

---

---

 1 return  $\sin(\theta)/\theta$ 

---

Common Lisp

```
(defun sinc (theta)
  (/ (sin theta)
     theta))
```

WeChat: cstutorcs

*What's wrong (mathematically) with this definition?*

Limit of  $\text{sinc } \theta$ 

$\lim_{\theta \rightarrow 0} \frac{\sin \theta}{\theta}$ 
 $\xrightarrow{\text{l'Hôpital's rule}}$ 
 $\lim_{\theta \rightarrow 0} \frac{\frac{d}{d\theta} \sin \theta}{\frac{d}{d\theta} \theta}$ 
 $\xrightarrow{\sim}$ 
 $\lim_{\theta \rightarrow 0} \frac{\cos \theta}{1}$ 
 $\xrightarrow{\sim}$ 
 $1$

Assignment Project Exam Help

## Conditional

IF

# Assignment Project Exam Help

Conditional execution based on a single test:

```
(if TEST THEN-EXPRESSION [ELSE-EXPRESSION])
```

Pseudocode

---

**Procedure** even?(n)

---

```
1 if 0 = mod(n, 2) then
2   | return true;
3 else
4   | return false;
```

---

Common Lisp

```
(defun even? (n)
  (if (test (= 0 (mod n 2)))
      then clause
      (t
       NIL)))
```

test  
then clause  
t  
NIL  
else clause

<https://tutorcs.com>

WeChat: cstutorcs

## Exercise: Conditionals

IF

Assignment Project Exam Help

$$\text{sinc}(\theta) = \begin{cases} 1 & \text{if } \theta = 0 \\ \frac{\sin \theta}{\theta} & \text{if } \theta \neq 0 \end{cases}$$

<https://tutorcs.com>

Pseudocode

Common Lisp

---

**Procedure** `sinc( $\theta$ )`

---

```

1 if 0 =  $\theta$  then
2   | return 1;
3 else
4   | return  $\sin(\theta)/\theta$ ;

```

---

WeChat: cstutorcs

```

(defun sinc (theta)
  (if (= 0 theta)
      1
      (/ (sin theta)
         theta)))

```

# Taylor Series

Represent function  $f(x)$  as infinite sum of derivatives around point  $a$ :

$$f(x) = f(a) + \frac{f'(a)}{1!}(x-a) + \frac{f''(a)}{2!}(x-a)^2 + \frac{f'''(a)}{3!}(x-a)^3 + \dots$$

$$= \sum_{n=0}^{\infty} \left( \frac{f^{(n)}(a)}{n!} (x-a)^n \right)$$

**WeChat: cstutorcs**

*Polynomial approximation of functions*

## Sinc Taylor Series

$$\frac{\sin \theta}{\theta} = 1 - \frac{\theta^2}{6} + \frac{\theta^4}{120} - \frac{\theta^6}{5040} + \frac{\theta^8}{362880} - \frac{\theta^{10}}{39916800} + \dots$$

## Conditional

## COND

## COND

Conditional execution of the first clause with a true test: (cond CLAUSES...)

where each clause is of the form: (TEST EXPRESSIONS...)

## Pseudocode

---

**Procedure** sign( $n$ )
 

---

- 1 if  $n > 0$  then return 1;
  - 2 else if  $n < 0$  then return -1;
  - 3 else return 0;
- 

## Common Lisp

```
(defun sign (n)
```

```
  (cond
    (test result
     (> n 0) 1)
    (test result
     (< n 0) -1)
    (test result
     (t 0))))
```

## Exercise: Conditionals

COND

$$\frac{\sin \theta}{\theta} = 1 - \frac{\theta^2}{6} + \frac{\theta^4}{120} + \dots$$

# Assignment Project Exam Help

Pseudocode

Common Lisp

---

**Procedure sinc( $\theta$ )**

---

1 if  $0 = \theta$  then

2 | return 1;

3 else if  $\theta^2 < .00001$  then4 | return  
|  $1 - \theta^2/6 + \theta^4/120$ ;

5 else

6 | return  $\sin(\theta)/\theta$ ;
<https://tutorcs.com>

(t (/ (sin theta)

theta))))

## Recursion

# Assignment Project Example: Factorial

Recursion: A function (or other object) defined in terms of itself

Base Case: Terminating condition

Recursive Case: Reduction towards the base case

$$n! = \begin{cases} 1 & \text{if } n = 0 \\ n * (n - 1)! & \text{if } n \neq 0 \end{cases}$$

---

**Procedure** factorial(*n*)

---

```

1 if 0 = n then // base case
2   return 1;
3 else // recursive case
4   return n * factorial(n - 1);

```

---

Example: Factorial

Assignment Project Exam Help

<https://tutorcs.com>

Pseudocode

Common Lisp

---

**Procedure** factorial(*n*)

---

```

1 if 0 = n then // base case
2   | return 1;
3 else // recursive case
4   | return
    |   n * factorial(n - 1);

```

---

(**defun** factorial (*n*)

⌞

(+ 1 (+ 2 (+ 3 (accumulate nil))))

⌞

(+ 1 (+ 2 (+ 3 0)))

## First-class functions

# Assignment Project Exam Help

Definition: First-class functions

A programming language has **first-class functions** when it treats functions like any other variable or object. First-class functions can be:

- ▶ Assigned to variables
- ▶ Passed as arguments to other functions
- ▶ Returned as the result of other functions

## Local Variables

### LET, LET\*

LET and LET\* create and initialize new local variables. LET operates in “parallel” and LET\* operates sequentially.

#### Example (LET)

```
(let ((a 1))  
  (let ((a 2)  
        (b a))  
    (print (list a b))))
```

#### Output

```
(2 1)
```

#### Example (LET\*)

```
(let ((a 1))  
  (let* ((a 2)  
         (b a))  
    (print (list a b))))
```

#### Output

```
(2 2)
```

# Closure

## Definition (Closure)

A function and an associated set of variable definitions. From “closed expression.”

## C Function Pointer

```
/* Definition */
struct context {
    int val;
};

int adder(struct context *cx, int x) {
    return cx->val + x;
}

/* Usage */
struct context c;
c.val = 1;
int y = adder(c, 2);
```

## Java Class

```
// Definition
class Adder {
    public int a;
    public Adder(int a_) {
        a = a_;
    }
    public int call(int x) {
        return x+a;
    }
}

// Usage
Adder A = new Adder(1);
int y = A.call(2);
```

## Closures in Lisp: Local Functions

### LABELS

Defines local functions and executes body using those local functions:

```
(labels ((FUNCTION-NAME VARIABLES FUNCTION-BODY)...) LABELS-BODY)
```

### Example

```
(let ((a 1))  
  (labels ((adder (x)  
            (+ x a)))  
    (adder 2)))
```

### Output

3

<https://tutorcs.com>

WeChat: cstutorcs

# Closures in Lisp: Anonymous Functions

## LAMBDA

Defines an anonymous function:

```
(lambda VARIABLES FUNCTION-BODY)
```

## FUNCALL

Apply a function to the provided arguments:

```
(funcall FUNCTION ARGUMENTS...)
```

### Example

```
(let ((a 1))  
  (funcall (lambda (x)  
             (+ x a))  
           2))
```

### Output

3

Assignment Project Exam Help

<https://tutorcs.com>

WeChat: cstutorcs

## Value and Function Namespaces

## Value Namespace

- ▶ Records values
- ▶ Local: `let`, `let*`
- ▶ Global: `defparameter`

## Function Namespace

- ▶ Records function definitions
- ▶ Local: `labels`, `flet`
- ▶ Global: `defun`

## Example

```
(defun foo (x) (+ 1 x))

(let ((foo 10))
  (print foo)           ; => 10
  (print (foo 1))       ; => 2
  (print (foo foo)))    ; => 11
```

## Output

```
10
2
11
```

## FUNCTION

(function NAME)

## Example

- ▶ (function +)
- ▶ (#' +)
- ▶ (defun foo (x) (+ 1 x))  
#'foo
- ▶ (labels ((foo (x) (+ 1 x)))  
#'foo)

# Project Exam Help

```
(funcall FUNCTION ARGS...)
```

Return value of FUNCTION  
called on ARGS....

## Example

- ```

► (funcall (lambda (x)
              (+ 1 x))
           1)
  ~→ 2

► (funcall #' + 1 2) ~→ 3

```

## Example Domain: Numerical Integration

## Runge-Kutta Methods

## Assignment Project Exam Help

Given: ▶ Derivative:  $\frac{d}{dt}x(t) = f(x, t)$

▶ Initial time:  $t_0$

▶ Final time:  $t_n$

▶ Initial value:  $x(t_0)$

Find:  $x(t_n)$

Solution: Follow derivative along discrete time intervals  $\Delta t$  from  $t_0$  to  $t_n$

## Example: Runge-Kutta 1 (Euler's Method)

# Assignment Project Exam Help

# Higher-order functions

Definition: Higher-order function

A function that takes another function as an argument or returns another function as its result.

## Example (Passing)

Function  $f(g,a)$

```
1 return g(42, a);
```

## Example (Returning)

Function  $f(a)$

```
1 function g(b) is  
2   | return a + b;  
3 return g;
```

## Counterexample

Function  $f(a,b)$

```
1 return a + b;
```

# Map function

## Definition (map)

Apply a function to every member of an input sequence, and collect the results into the output sequence.

$$\text{map} : (\underbrace{X \mapsto Y}_{\text{function}}) \times \underbrace{X^n}_{\text{input sequence}} \mapsto \underbrace{Y^n}_{\text{output sequence}}$$

## Illustration

## Example: Map

$+1$   
 $\lambda x. x + 1$

# Assignment Project Exam Help

$(1\ 2\ 3)$   $\rightarrow$  **MAP**  $\rightarrow (1 + 1\ 2 + 1\ 3 + 1) \rightarrow (2\ 3\ 4)$

<https://tutorcs.com>

$\neg$

# WeChat: cstutorcs

$(\text{true false true})$   $\rightarrow$  **MAP**  $\rightarrow (\neg\text{true}\ \neg\text{false}\ \neg\text{true}) \rightarrow (\text{false true false})$

## Algorithm: Map function

Functional Map

---

**Procedure** map(f,s)

---

```
1 if empty(s) then /* s is empty */
2   | return NIL
3 else /* s has members */
4   | return cons(f(first(s)), map(f,rest(s));
```

---

Imperative Map

---

**Procedure** map(f,s)

---

```
1 n ← length(s);
2 Y ← make-sequence(n);
3 i ← 0;
4 while i < n do
5   | Y[i] ← f(s[i]);
6   | i ← i + 1;
7 return Y;
```

---

## Example: Map

Example (Illustration)

Assignment Project Exam Help

```
(lambda (x)
  (+ x 1))
```

MAP

(2 3 4)

<https://tutorcs.com>

Example (Lisp)

WeChat: cstutorcs

```
(map 'list (lambda (x) (+ 1 x)) (list 1 2 3))
;; RESULT: (2 3 4)
```

## Fold-left

## Definition (fold-left)

Apply a binary function to each member of a sequence and the prior result, starting from the left.

$$\text{fold-left} : (\underbrace{\mathbb{Y} \times \mathbb{X} \mapsto \mathbb{Y}}_{\text{function}}) \times \underbrace{\mathbb{Y}}_{\text{init.}} \times \underbrace{\mathbb{X}^n}_{\text{sequence}} \mapsto \underbrace{\mathbb{Y}}_{\text{result}}$$

## Illustration

WeChat: cstutorcs

## Example: Fold-left

## Example (Addition)

## Example (Subtraction)

## Algorithm: Fold-left

## Assignment Project Exam Help

## Imperative

---

**Function** fold-left( $f$ ,  $y$ ,  $X$ )

---

```
1  $i \leftarrow 0$ ;  
2 while  $i < |X|$  do  
3    $y \leftarrow f(y, X_i)$ ;  
4    $i \leftarrow i + 1$ ;  
5 return  $y$ ;
```

---

## Functional

---

**Function** fold-left( $f$ ,  $y$ ,  $X$ )

---

```
1 if empty( $X$ ) then return  $y$ ;  
2 else  
3   let  $y' \leftarrow f(y, \text{first}(X))$  in  
4   return fold-left( $f$ ,  $y'$ , rest( $X$ ));
```

---

<https://tutorcs.com>

WeChat: cstutorcs

Example: Fold-left in Lisp

# Assignment Project Exam Help

## Example (Addition)

```
(reduce #'+'(1 2 3)
        :initial-value 0)
;;; => (+ (+ (+ 0 1) 2) 3)
;;; => 6
```

## Example (Subtraction)

```
(reduce #'-'(1 2 3)
        :initial-value 0)
;;; => (- (- (- 0 1) 2) 3)
;;; => -6
```

## Exercise: Fold-Left Reverse

## Assignment Project Exam Help

$$(a_0 \ a_1 \ \dots \ a_{n-1} \ a_n) \xrightarrow{\text{reverse}} (a_n \ a_{n-1} \ \dots \ a_1 \ a_0)$$

---

**Procedure reverse**

---

```

1 function h(r, x) is
2   return cons(x, r);
3 return fold-left(h, nil, L);
```

```

(defun reverse-fold (list)
  (reduce (lambda (reversed x)
            (cons x reversed))
          list
          :initial-value nil))
```

## Fold-right

## Definition (fold-right)

Apply a binary function to each member of a sequence and the prior result, starting from the right.

$$\text{fold-right} : (\underbrace{\mathbb{X} \times \mathbb{Y} \mapsto \mathbb{Y}}_{\text{function}}) \times \underbrace{\mathbb{Y}}_{\text{init.}} \times \underbrace{\mathbb{X}^n}_{\text{sequence}} \mapsto \underbrace{\mathbb{Y}}_{\text{result}}$$

<https://tutorcs.com>

## Illustration

## Example: Fold-right

## Example (Addition)

## Example (Subtraction)

## Algorithm: Fold-right

## Assignment Project Exam Help

## Procedural

---

**Function** fold-right( $f, y, X$ )

---

```
1  $i \leftarrow |X| - 1$ ;  
2 while  $i \geq 0$  do  
3    $y \leftarrow f(X_i, y)$  ;  
4    $i \leftarrow i - 1$  ;  
5 return  $y$ ;
```

---

## Recursive

---

**Function** fold-right( $f, y, X$ )

---

```
1 if empty( $X$ ) then return  $y$ ;  
2 else  
3   let  $y' \leftarrow$  fold-right( $f, y$ , rest( $X$ )) in  
4   return  $f$ (first( $X$ ),  $y'$ );
```

---

<https://tutorcs.com>

WeChat: cstutorcs

## Example: Fold-right in Lisp

## Assignment Project Exam Help

## Example (Addition)

```
(reduce #'+
        '(1 2 3)
        :initial-value 0
        :from-end t)
;;; => (+ 1 (+ 2 (+ 3 0)))
;;; => 6
```

## Example (Subtraction)

```
(reduce #-
        '(1 2 3)
        :initial-value 0
        :from-end t)
;;; => (- 1 (- 2 (- 3 0)))
;;; => 2
```

<https://tutorcs.com>

WeChat: cstutorcs

# Application: MapReduce

---

**Function** `MapReduce(f,g,X)`

---

```

1 Y ← parallel-map(f, X);
2 return reduce(g, Y);

```

---

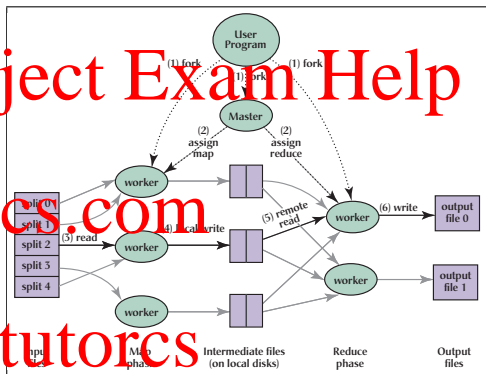

► Idea:

- (parallel) map
- (serial) reduce/fold

► Provides scalability,  
fault-tolerance

► Implementations:

- Google MapReduce
- Apache Hadoop

Programming Environment

## Data Types

## Definition (Data type)

A classification of data/objects based on how the data/object is intended to or able to be use.

The set of values a variable may take.

## Example

- ▶ `int`
- ▶ `float`
- ▶ `List`
- ▶ `String`
- ▶ Structures:
  - ▶ `int × string`
  - ▶ `float4`
- ▶ Function:
  - ▶ `int × int  $\mapsto$  bool`

WeChat: cstutorcs

# Data Type Systems

## ► Type Checking/Binding

Static: Check types at compile time (statically)

Dynamic: Check types at run time (dynamically).

## ► Type Enforcement

Strong: Object types are strictly enforced

Weak: Objects can be treated as different types (casting, “type punning”)

## ► Examples:

- C: static/weak
- Python: dynamic/strong
- ML and Haskell: static/strong
- Lisp: dynamic (mostly) / strong

## Machine Words – Representing Data

word

unsigned

 $42 \rightsquigarrow 0x2a$ 

signed

## Style Notes

## New Lines

Newlines emphasize structure:

## Good Style

```
(and (or a (not b))
      (or b c))
```

## Bad Style

```
(and (or a (not b)) (or b c))
```

## Closing Parenthesis

Closing parenthesis on same line.

## Good Style

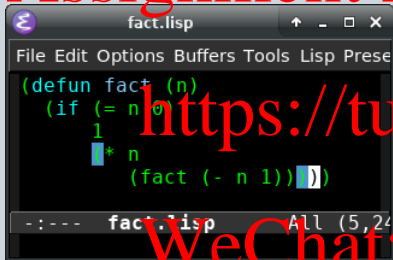

```
(defun foo (x)
  (+ 1 x))
```

## Bad Style

```
(defun foo (x)
  (+ 1 x)
)
```

## Emacs Tips

## Parenthesis Matching

```

(defun fact (n)
  (if (= n 0)
      1
      (* n
         (fact (- n 1)))))

```

fact.lisp All (5,24)

.emacs

```
(show-paren-mode 1)
```

## Viper Mode

- ▶ vi implementation/emulator in Emacs
- ▶ User Manual

.emacs

```
(setq viper-mode t)
(require 'viper)
```

## Why use Lisp?

(Why learn something different?)

# Assignment Project Exam Help

### ► Functional Programming:

- Planning algorithms often are functional/recursive
- Lisp has good support for functional programming.

### ► Symbolic Computing:

- Planning algorithms must often process symbolic expressions
- Lisp has good support for symbolic processing

- A good fit for (the first half of) this course
